Task 3 — Pharmacy Sales & Drug Analysis

Virtual Works Lab | B.Pharmacy Internship Project

Project Objective

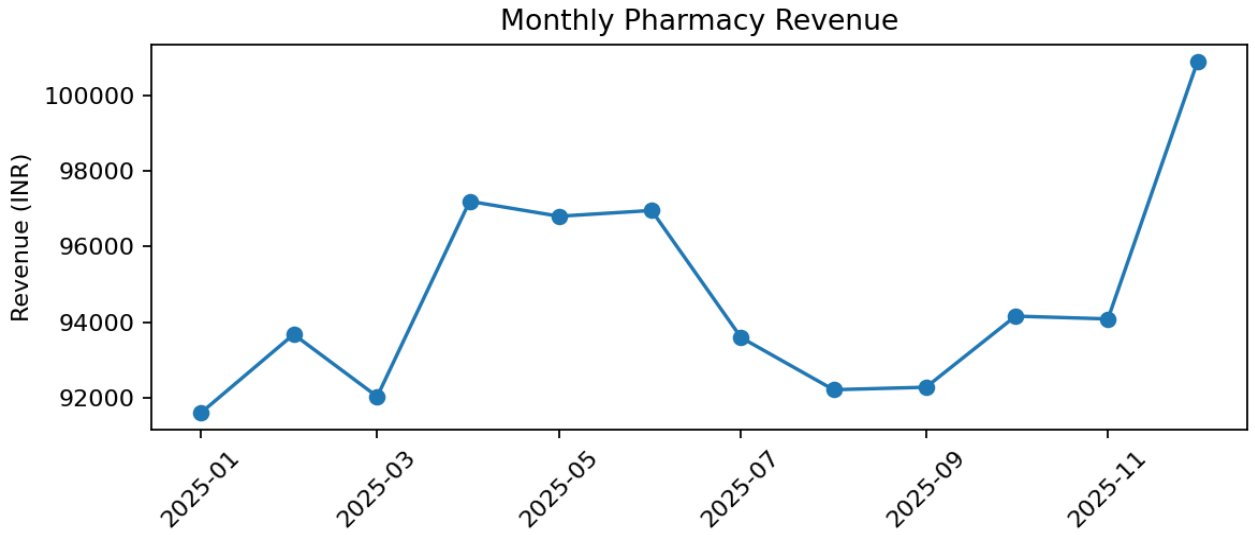

Analyze pharmacy sales data to identify medicine usage trends and revenue patterns, evaluate top-selling medicines, monthly sales growth, and branded versus generic medicines.

Dataset

Synthetic educational pharmacy sales dataset covering January–December 2025. It contains medicine, product type, units sold, unit price in INR, and calculated revenue.

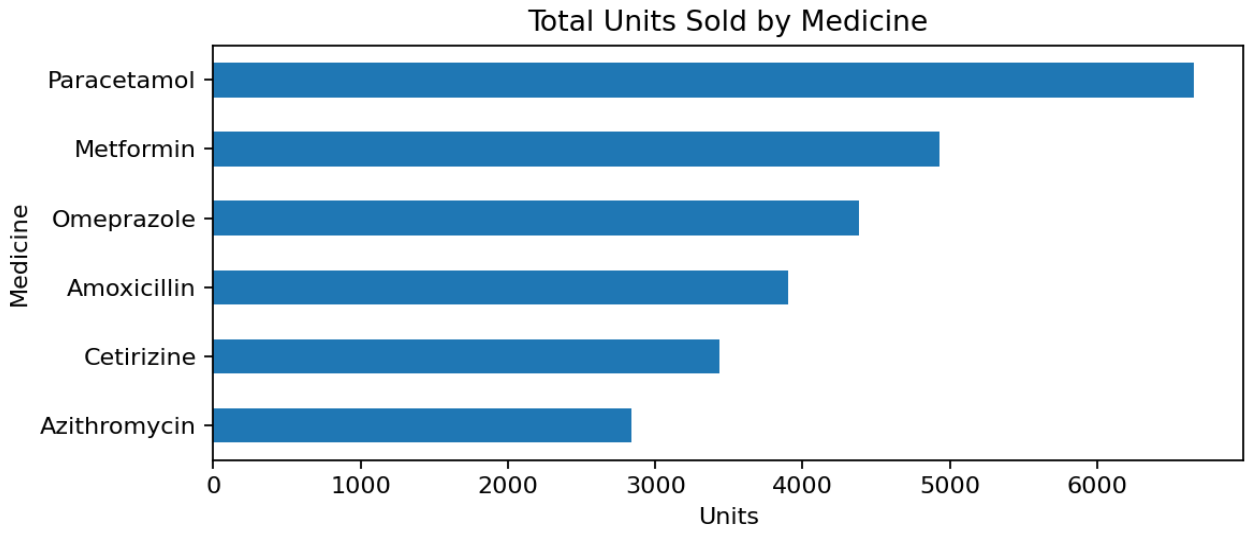

1. Monthly Sales Growth

Month	Revenue_INR	Growth_%
Jan-2025	91598	nan
Feb-2025	93673	2.27
Mar-2025	92023	-1.76
Apr-2025	97202	5.63
May-2025	96806	-0.41
Jun-2025	96960	0.16
Jul-2025	93587	-3.48
Aug-2025	92204	-1.48
Sep-2025	92270	0.07
Oct-2025	94156	2.04
Nov-2025	94082	-0.08
Dec-2025	100901	7.25

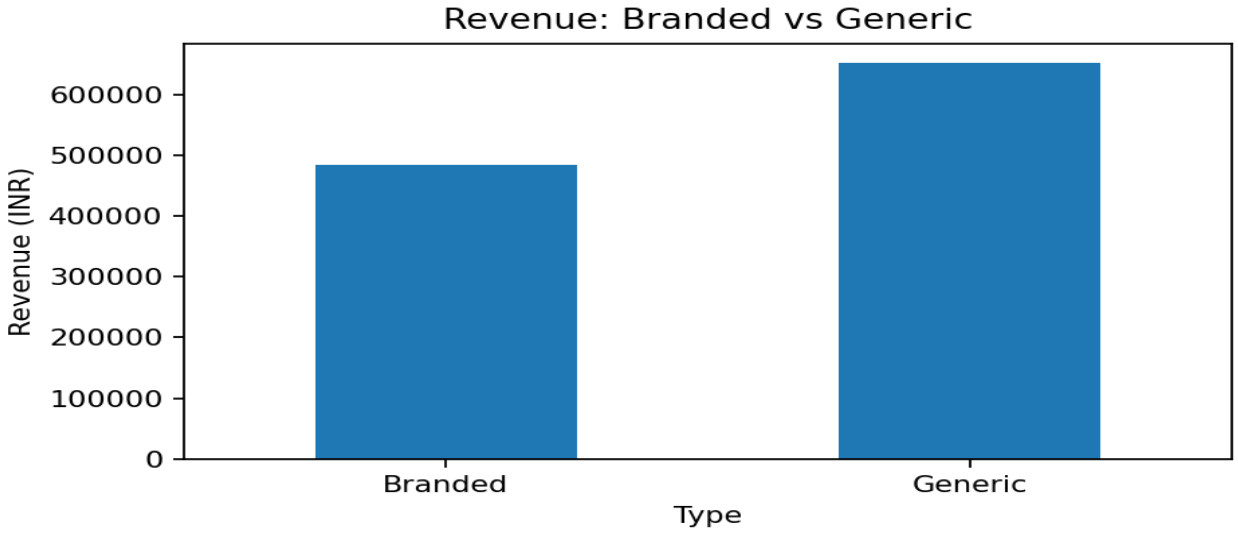

2. Top-Selling Medicines

Total_Units	Total_Revenue_INR
6658	119844
4932	271260
4381	271622
3900	163800
3437	96236
2836	212700

3. Branded vs Generic Comparison

Units	Revenue_INR	Revenue_Share_%
7217	484322	42.65
18927	651140	57.35

Key Findings

• Paracetamol recorded the highest total unit volume (6,658 units).

• Total modeled revenue changed from ■91,598 in January to ■100,901 in December.

- Generic products generated 57.3% of total modeled revenue, while branded products generated 42.7%.
- Higher revenue does not necessarily mean higher unit volume because medicine prices differ.
- These results are based on synthetic data and should not be interpreted as real pharmacy-market findings.

Conclusion

The project demonstrates how pharmacy sales data can be summarized to identify high-volume medicines, revenue trends, growth patterns, and product-type differences.
